1.2. Minimum Risk Point Estimation (MRPE)							

- Originally formulated in Robbins (1959).
- Assuming  $X_1, ..., X_n \stackrel{i.i.d.}{\sim} N(\mu, \sigma^2)$ , with  $\mu$  and  $\sigma^2$  both unknown.

- Originally formulated in Robbins (1959).
- Assuming  $X_1, ..., X_n \stackrel{i.i.d.}{\sim} N(\mu, \sigma^2)$ , with  $\mu$  and  $\sigma^2$  both unknown.
- Loss function:

$$L_n \equiv L_n(\mu, \overline{X}_n) = A(\overline{X}_n - \mu)^2 + cn, \qquad (1)$$

where A(>0) and c(>0) are both known.

・ロト ・ 同ト ・ ヨト ・ ヨト

- Originally formulated in Robbins (1959).
- Assuming  $X_1, ..., X_n \stackrel{i.i.d.}{\sim} N(\mu, \sigma^2)$ , with  $\mu$  and  $\sigma^2$  both unknown.
- Loss function:

$$L_n \equiv L_n(\mu, \overline{X}_n) = A(\overline{X}_n - \mu)^2 + cn, \qquad (1)$$

where A(>0) and c(>0) are both known.

Risk function:

$$R_n(c) \equiv E_{\mu,\sigma}[L_n(\mu, \overline{X}_n)] = A\sigma^2 n^{-1} + cn.$$

## Accelerated Sequential MRPE Saving Sampling Operations

► Given the pilot sample size m ≥ 2, 0 < ρ ≤ 1 and k ≥ 1, an integer, consider the following stopping rule:</p>

$$T \equiv T(c) = \inf \left\{ n \ge 0 : m + kn \ge \rho \sqrt{A/c} \left[ W_{m+kn} + (m+kn)^{-\lambda} \right] \right\}$$

## Accelerated Sequential MRPE Saving Sampling Operations

► Given the pilot sample size m ≥ 2, 0 < ρ ≤ 1 and k ≥ 1, an integer, consider the following stopping rule:</p>

$$T \equiv T(c) = \inf \left\{ n \ge 0 : m + kn \ge \rho \sqrt{A/c} \left[ W_{m+kn} + (m+kn)^{-\lambda} \right] \right\}$$

The final sample size is then given by

$$N \equiv N(c) = \lfloor \rho^{-1}(m+kT) \rfloor + 1,$$

where |u| means the largest integer smaller than u.
